

Solution Requirements

Import Data Using Transform Maps (Spreadsheet)

Date	02 October 2026
Team ID	SWTID - 2026-5675
Project Name	Import Data Using Transform Maps (Spreadsheet)
Maximum Marks	4 Marks

Define Functional and Non-Functional Requirements:

The requirements below define what the spreadsheet import solution will do and how well it should perform. Functional requirements describe system functions, while non-functional requirements describe quality, security, reliability and performance.

Step 1: Functional Requirements (FR)

S.No	Requirement Category	Requirement Description	Priority (High/Medium/Low)
1	Authentication	Users must securely log in and verify their identity before accessing the import process.	High
2	Authorization levels	Only authorized users can upload spreadsheets, create/update Transform Maps, run imports and view import results.	High
3	External interfaces	The system must accept spreadsheet files such as CSV/XLSX and connect to the target table/database used for imported records.	High
4	Transactions processing	The system must validate spreadsheet data, map source fields to target fields, transform values, import valid records and report errors for invalid records.	High
5	Reporting	The system should provide import status, number of successful/failed records, error details and a summary of the import.	Medium

Step 2: Non-Functional Requirements (NFR)

S.No	Requirement Category	Requirement Description	Priority (High/Medium/Low)
1	Security	User access and imported data must be protected from unauthorized access.	High
2	Performance	Spreadsheet validation and import should complete within a reasonable time for the expected file size.	Medium
3	Reliability	The system should handle invalid records without stopping the entire import and should provide clear error information.	High
4	Usability	The import process, field mapping and error messages should be simple and easy for users to understand.	Medium
5	Scalability	The solution should support increasing spreadsheet size and record volume without major changes.	Medium

Expected Outcome:

- Spreadsheet data is validated before import.
- Source fields are correctly mapped to target fields using Transform Maps.
- Data transformations are applied where required.
- Valid records are imported successfully.
- Failed records and errors are clearly reported.
